Goals

Business The business goal of this project was to test the prototype of the new online ordering app for New Brews Coffee Co., a fictitious coffee shop chain with 4 locations in Upstate New York north of Albany. This testing has allowed for New Brews to implement changes and improvements to the proposed app service before it officially launches to the public.

User The user goal of this work was to test the process where customers select, order and purchase items for pickup at the nearest New Brews location.

My Roles

Usage Analysis
UX Strategy
Market Research
Interaction Design
Prototyping
Usability Testing
Icon Design

"Colin Neal has a deep passion for information design, information architecture and web development technologies. Colin has demonstrated that he has an extensive knowledge of these fields through his graduate academic studies, completing an Information Technology MS and a Communication Studies MA from Clarkson University and a Certificate in Web Programming from Champlain College."

Gavin Smith,
Director of Operations
New Brews Coffee Co., LLC

Strategies and Objectives

Strategy 1 Better categorize the menu content to make it easier for customers to select the specific location they want to shop at, as well as provide a wider selection items in certain categories.

Objective 1 Make the breakfast and lunch categories much more well defined.

Objective 2 Add additional items to the menu/shopping cart where it appears that the existing selection is lacking.

Strategy 2 Make it easier for customers to select the specific location where they wish to pickup their order.

Objective 1 Provide customers with more opportunities to select their desired location, as well as provide enhanced visuals (ie. interactive map).

Persona and Scenario - Young Professional Woman

Order Morning Coffee

Caitlin is a web developer from Saratoga Springs, New York who likes to order a cup of hot coffee every morning before starting work.

Because Caitlin is busy and has numerous time constraints, she would prefer to use an online ordering app where her orders can be placed in advance. Caitlin finds it very important that the menu system of the new app be very easy to use without any major time-consuming hassles.

Original Task Flow

When I began testing the initial task flow of the prototype that I developed, I started to think about what a customer may be for ordering a morning coffee. I wanted to **see how the ordering process of clicking through numerous screens** and how they **want to customize an order of their favorite item.**

I started to wonder whether there was a way that this process could be made easier for customers who always ordered the exact same item(s) with the exact same customized options always being selected. **For instance, could someone who orders a Grande Iced Vanilla Sweet Cream Cold Brew with Three Splenda and 2% milk do so with only one or two clicks/taps?**

Task Flow A 8 Clicks/Taps

In my initial high fidelity UI prototype, customers who wished to order a single item, such as a cup of hot coffee, were essentially required to navigate through the following sequence of screens a minimum of eight clicks/taps. First, the customer proceeded from the home page to the menu category page before selecting the beverages menu where they clicked/tapped on the icon for hot coffee (3 clicks/taps). Once the coffee was selected, the user then proceeded to the customization page where they could further customizing their order (5 clicks/taps for hot coffee, even more clicks/taps may be required for other items).

While the initial task flow for the menu doesn't really have any serious deficiencies, it is not really efficient for frequent customers who almost always decide to order the same item(s) with the same customized options.

The Improved Task Flow

The issues that I encountered made me feel as though a solution could be developed by adding a "Recently Ordered Items" section to the "My New Brews" customer portal area.

Modified Task Flow 3 Clicks/Taps

Under the modified task flow, the user clicks/taps on the circular icon in the upper left-hand screen corner which then takes them to the "My New Brews" customer portal area. When the "My New Brews" page opens, the user then clicks/ taps on the "Recently Ordered Items" section which then opens a page that displays all of the items that the customer has ordered over the past month.

The user now only needs to make one more click/tap to re-order an item that they have recently purchased (with all of their previous customizations/options being saved).

Wireframing, Prototyping, and Testing

Once I developed a new simplified task flow for the menu that was oriented towards frequent customers, I began to think about other ways that the user experience could potentially be enhanced for those who regularly visit and order items from the app.

Add a "We Suggest" Area

One idea that immediately came to mind that could potentially help to keep frequent customers more engaged with the online ordering app was to add a "We Suggest" area which displays a group of clickable menu items that are selected based upon the customer's most recent activities on the app (ie. recent searches, orders, items viewed).

The "We Suggest" area would appear directly underneath the list of recently ordered items that was just added to the task flow in the "My New Brews" customer portal. The placement of the "We Suggest" area was selected as it is a fairly good way to entice customers to try some new items that they could potentially be interested in during the next time that they place their order.

Create Specials or Discounts Based on a Customer's Most Recent Orders

Another idea that I had which could help to keep frequent customers more engaged with the online ordering app would be to offer specials and discounts that are based on their most recent activities on the app. Perhaps a "Today's Specials" area could be added to the home page and other additional pages of the site.

When the customer clicks on the card for each item, it is added to their shopping cart at the checkout screen (after the order is further customized).

High Fidelity Design

This project concluded with a number of modifications being made to the high fidelity UI prototype of the online ordering app service. Throughout this section, I share my own feedback on some of the most substantial modifications that were made to the prototype.

The enhanced design of the final UI prototype for the online ordering app primarily utilizes Google's Material Design guidelines, which takes a minimalistic "flat-like" aesthetic approach. In addition, most of the color palette for the app was developed from Google's open source Foundation framework that was originally developed by Zurb, a Cincinnati, OH based design firm.

Better Organization Of Menu Content

All breakfast menu items are now organized into a new "All-Day Breakfast" category area that appears underneath the beverages area. This should make it much easier for morning customers to quickly select a breakfast item after ordering coffee.

Make It Easier for Customers to Find and Set Their Location Preference

To help customers find and select the location where they wish to pick up their order, an interactive map was added to the locations page with pins identifying the exact location of every New Brews store.

Each pin can be tapped by the customer so they can find out more detailed information (ie. daily hours) about every store.

The Results

Topline Revenue When New Brews officially launches its online ordering app to the general public, there is an estimation that monthly same-store sales revenues will increase by 25%-30%. In addition, the online ordering service will help New Brews to better compete against national chains such as Dunkin' and Panera, as well as local independent coffee shops such as Stewart's Shops, Saratoga Springs Coffee Traders, Fro Coffee (Saratoga Springs), Glens Falls and Cool Beans (Queensbury).

Operational Efficiencies The implementation of an online ordering app will help to streamline the ordering process. Because so many customers will likely order online in advance, this will substantially shorten the customer wait time.
